

class MyThread

implements

Runnable (interface)

has run() method, we use this method to give task to a thread (like print 1-10 numbers)

extends

Thread (class)

has start() method which is used to start execution of a thread

internally implement Runnable interface

^o If we extend Thread class,

- then we will get `run()` and `start()` methods
- but we can't extend multiple classes

If we implements Runnable interface,

- then we can still extend one class or multiple interfaces
- here we will get `run()` method, but to start a thread we have to create object of Thread class
