

There are 2 limitations of an array

1. fixed size

2. homogeneous value (same data type)

So, to overcome from above limit^s we have

Collection framework

group
of
objects/datatype

predefined code

- interface
- class
- method

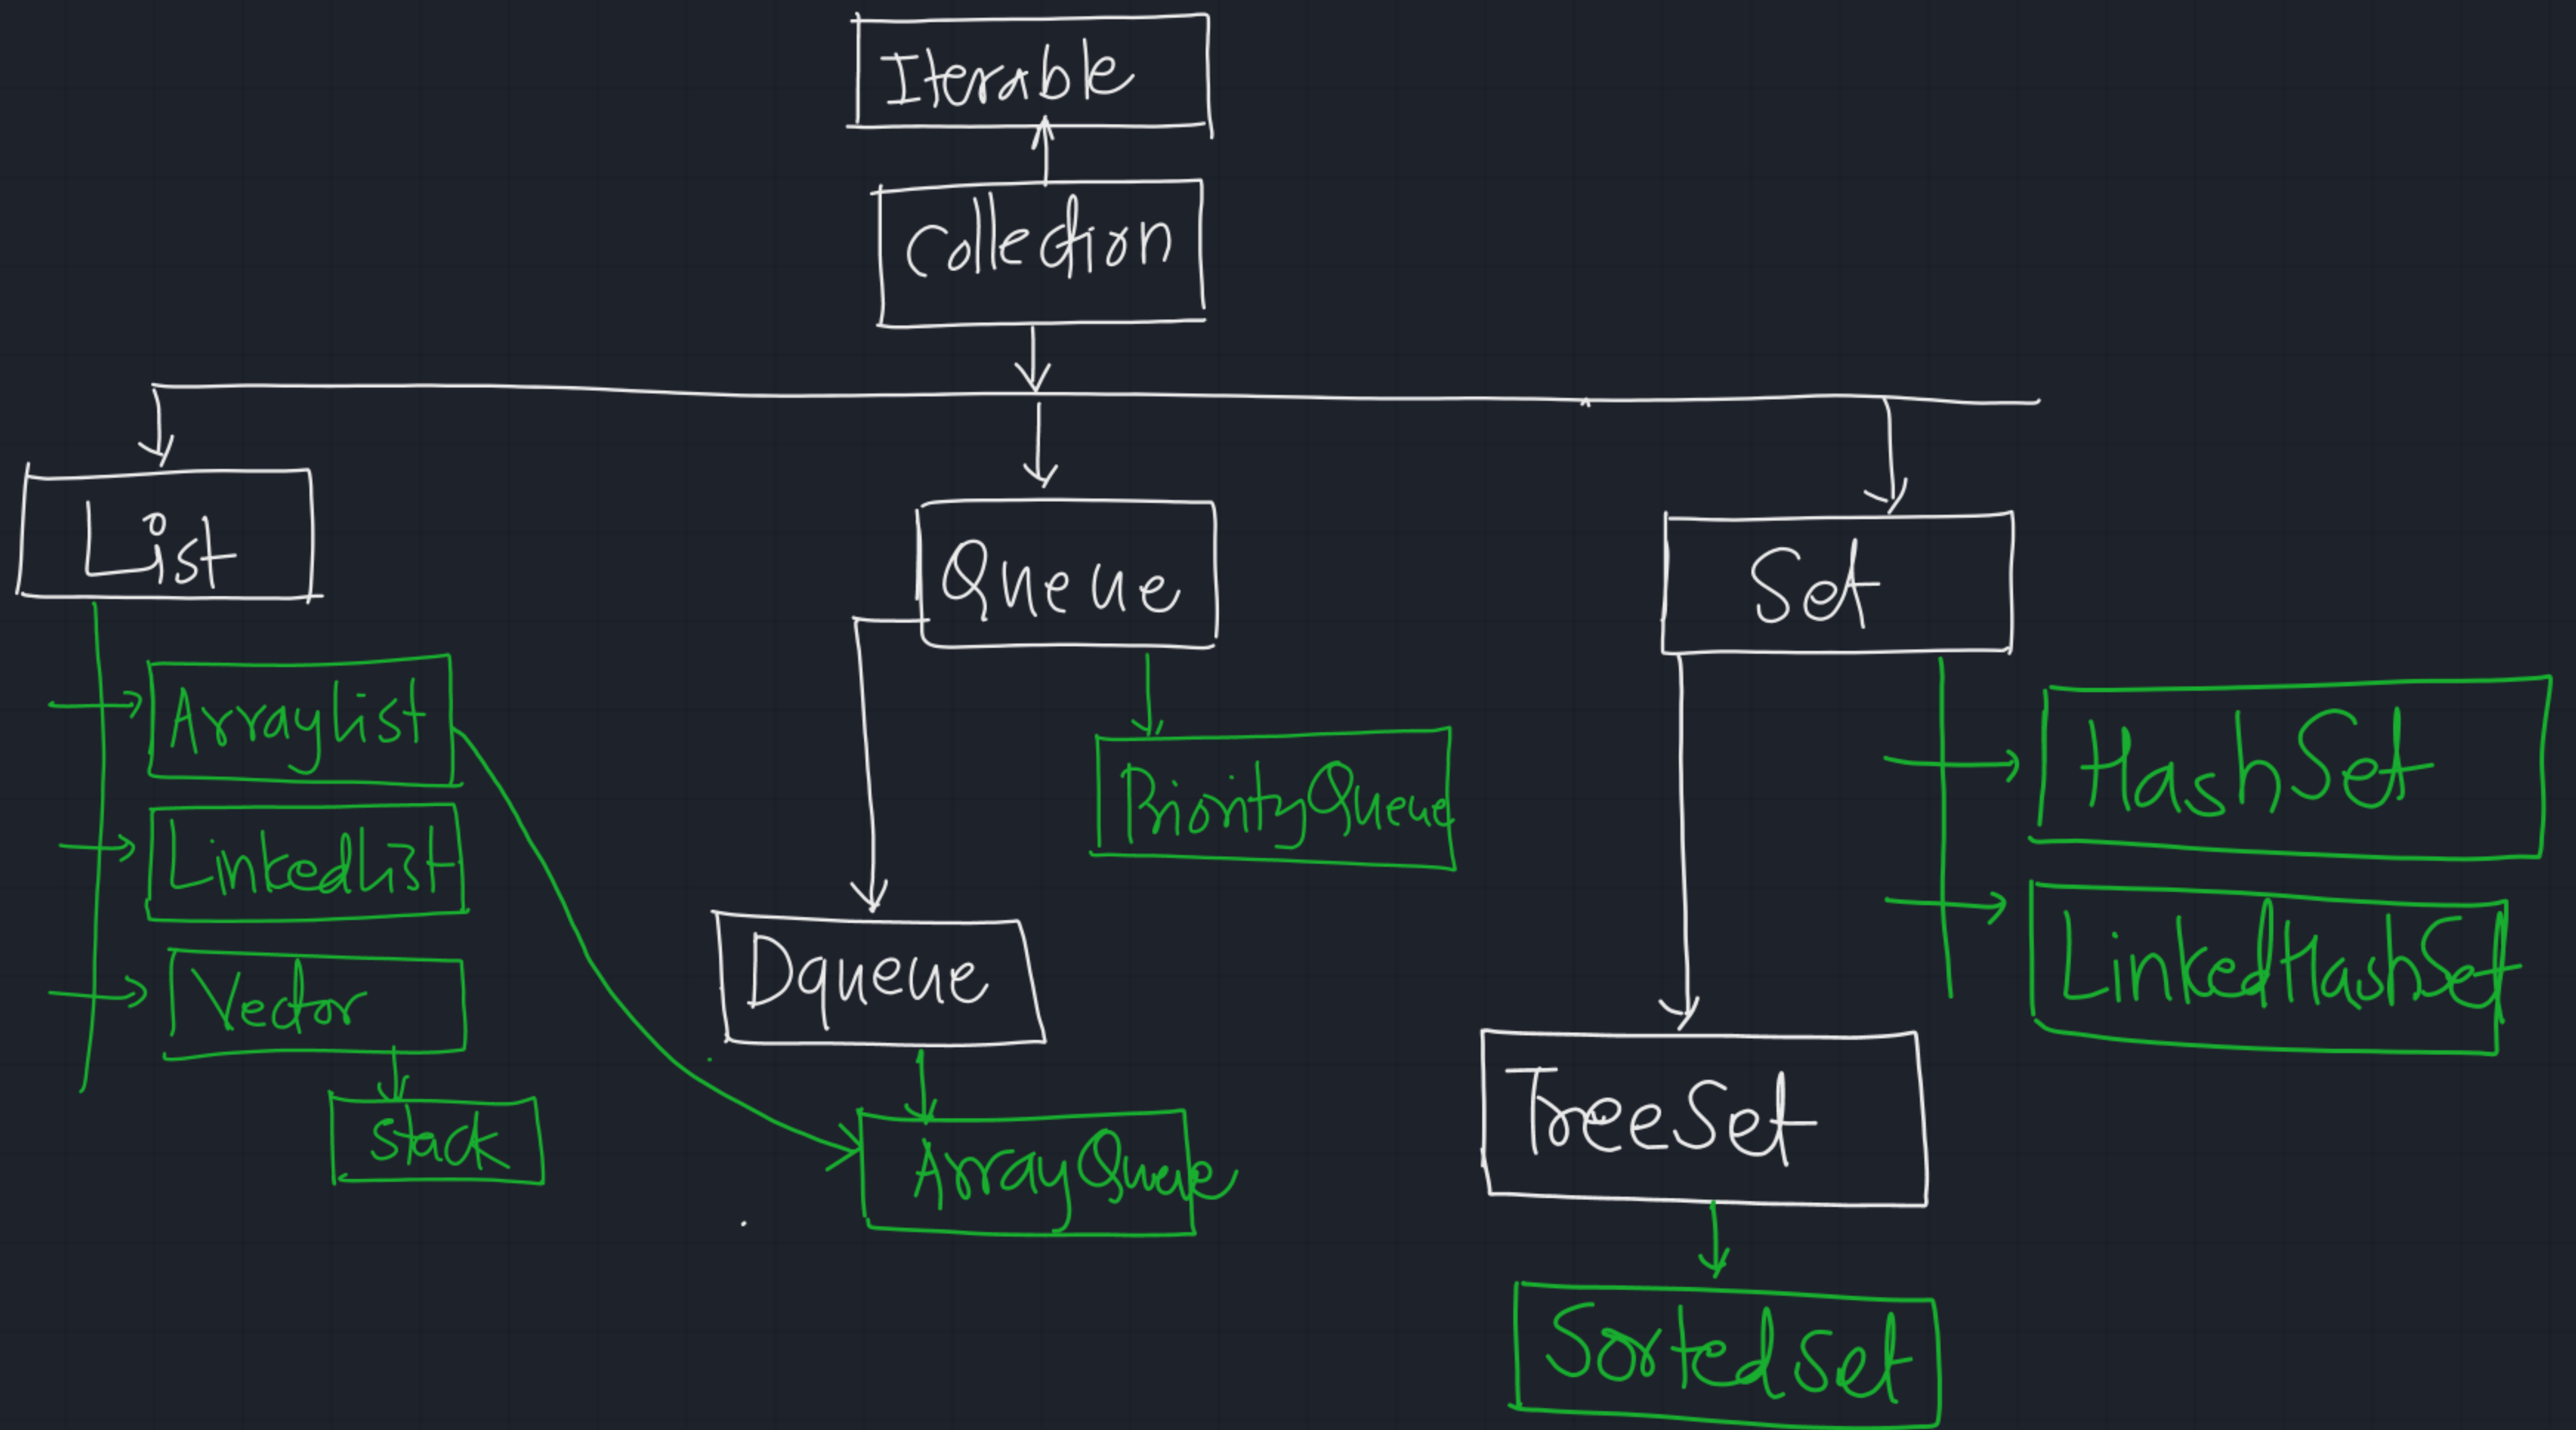

to manipulate, search, sort in group of objects
add, *update, delete

↓ use?

Defination: -

colp framework in java consist of some predefined interfaces, classes and methods which we used to add, update, delete, sort, search in group of objects.

A group of objects can be manipulate, search or sort by some predefined interfaces, objects or methods present in java.

List

Set

- duplicates

✓

✗

- indexing

✓

✗

- insertion order

✓

✗ (LinkedHashSet)

→ we can get element at any index of list but
in queue we get only head & tail

→ FIFO → Queue
first In first Out

— we can add & remove element from both end
from queue but from only ^{one} end in list
